

# SE LAB04

## Prompts used for updation :

### Task 1: Fix the high-score bug

**PROMPT→** I am a gamer and I built this Arm Wrestle Showdown game using Python and Pygame. While testing my game, I noticed that the player's arm is moving in the wrong direction. The player should win when arm\_position reaches -100, but currently both Left and Right arrow key presses increase arm\_position by 4.2. Please fix this so that valid alternating Left and Right key presses move the arm toward the negative direction. Keep the existing alternating-key mechanism, stamina system, and win/loss conditions unchanged, and make sure the game runs without errors after the fix.

### Task 2: Implement dino\_tint(on\_ground)

**PROMPT→** Implement a dynamic AI difficulty system in my existing game\_engine.py. Make the AI gradually build energy, periodically trigger a strong power surge lasting 1–2 seconds, then become exhausted with reduced force before recovering. Keep normal AI randomness, player mechanics, win/loss logic, and the existing game structure unchanged. Reset all AI states properly when starting a rematch. Ensure there are no undefined variables or errors.

### Task 3: Implement on\_obstacle\_passed(obstacle, score)

**PROMPT→** Add an exhaustion warning to my existing game\_engine.py. When player stamina is  $\leq 10$  and input is disabled, display a clear visual "EXHAUSTED!" warning and/or flashing stamina indicator. Hide the warning automatically when stamina rises above 10. Keep stamina consumption, recovery, AI behavior, game states, and the existing layout unchanged. Ensure the implementation has no errors.

## Task 4: Implement max\_jumps()

**PROMPT→** Review the existing exhaustion warning implementation and make sure it provides clear visual feedback whenever player stamina is  $\leq 10$  and player input is disabled. Do not create duplicate exhaustion logic. Fix only anything missing and ensure the complete game continues to run correctly without errors.
